## **Technology, Information, Policy and Economics - Development of risk reduction**

Ryoji Sakai, URMPM Chair

The purpose of URMPM activities is development of global risk reduction, together with all scientists around the world, because of rapid increase in natural disasters and biological environment risk such as bird influenza due to population growth, which has extended the residence with few safety development, and of food risk, medical accident and risky man-made environment due to rapid socio-economical globalization.

The basic risk reduction factors can be identified as technology, information, policy, economics and human network, etc. A rich class has already developed the knowledge and skill, and can develop more. For an example, Japan can be identified as one of those countries, as this country has a lot of experiences in earthquake, tsunami, typhoon, volcano, flood due to narrow and rapid rivers with many mountains in a small land, and environmental pollutions by high industrialization. Japan is still developing crisis management system for megacity crushes by earthquake. Thus, we asked Japan to transfer their risk reduction technologies to the world.

A lot of scientists and experts in many Japanese sectors agreed to hold the international conference of global transfer of safety and health technology. We also asked several European countries with high-advanced technologies to joint us, as it is clear that those countries' technologies have very high values to improve crisis management toward the world safety and health.

This international scientific conference on November 1-2, 2005 is mainly organized by our respected members at 'International Center of Urban Safety Engineering', the Institute of Industrial Science, the University of Tokyo. You can find a lot of high advanced technologies there, and the bulletin of the conference has been available as follows.

<http://www.urmpm.org/1Safetech/bulletin.pdf>

The conference also contains the topics of new development in HIV vaccine to AIDZ and clinical risk management of hepatitis viruses, as virus risk management is one of urgent topics in the current world. The conference will discuss new crisis management system adjusted with financial and economic issues, too.

We are sure that this technological conference will be helpful for you. Let's joint in this conference and discuss together, to promote safety and health development.
