(New establishment of international clinical infection information system)

The new coronavirus will continue to repeat mutations in several areas around the world to adapt to the environments. Symptoms of mutant viruses are not always the same. Someday, some location in the world, a death virus may happen.

The clinical signs and symptoms of the virus differ slightly by variant. Therefore, for quick prevention, it is necessary to develop a global information exchanging and sharing system for real-time clinical information of Covid-19.

Such a clinical information network of Covid-19 should be established among major university hospitals in the world.

The rapid clinical information sharing system guarantees the most advanced medical care and public health toward all people around the world.

All governments should work together to invest in the new clinical system development to defend against further pandemics.
